

The rest is up to you!

If you're really comfortable with SQL, you can probably get it from here.

But [click here](#) to show the schema diagram.

And you can always go to the [walkthrough](#).

Use your knowledge of the database schema and SQL commands to find out who committed the murder.

When you think you know the answer, go to the next section.

```
1 SELECT p.name
2 FROM person p
3 JOIN drivers_license d
4 ON p.license_id = d.id
5 JOIN facebook_event_checkin f
6 ON p.id = f.person_id
7 WHERE d.gender = 'female'
8 AND d.hair_color = 'red'
9 AND d.height BETWEEN 65 AND 67
10 AND d.car_make = 'Tesla'
11 AND d.car_model = 'Model S'
12 AND f.event_name = 'SQL Symphony Concert'
13 AND f.date BETWEEN 20171201 AND 20171231
14 GROUP BY p.id, p.name
15 HAVING COUNT(*) = 3;
```

RUN ↗

RESET

name
Miranda Priestly

Check your solution

Did you find the killer?

```
1 INSERT INTO solution VALUES (1, 'Miranda Priestly');
2
3 SELECT value FROM solution;
```

RUN ↗

RESET

value	
Congrats, you found the brains behind the murder! Everyone in SQL City hails you as the greatest SQL detective of all time. Time to break out the champagne!
