

Weekly Report of Week-8

1. Briefly summarize the core tasks you completed this week.

This week, I worked on preparing my Business Intelligence Capstone Outline and created a six-slide Data Story Deck based on the Indian Crop Production dataset. I organized the project into a structured business story, highlighting the problem, dataset, key insights, and recommendations. I also completed a peer review of another intern's dashboard by evaluating its strengths, suggesting improvements, and asking constructive questions about the methodology.

2. What challenges or roadblocks did you face this week, and how did you handle them?

The main challenge was presenting the analysis as a business story instead of simply describing charts. I addressed this by focusing on the business problem first, then connecting each visualization to a clear insight and practical recommendation. This helped make the presentation more meaningful and easier to understand.

3. What extra steps or creative ideas did you explore beyond the basic module?

Beyond the module requirements, I improved the visual consistency of the Data Story Deck by using a professional color palette, consistent typography, and a clear presentation layout. I also refined the AI-generated narratives to ensure they accurately reflected the dashboard findings and avoided unsupported conclusions, making the final presentation more reliable and business-focused.

4. What was your biggest learning this week?

My biggest learning this week was understanding how important storytelling is in Business Intelligence. I learned that dashboards alone are not enough; the insights must be presented in a way that clearly explains the problem, the

findings, and the recommended actions. I also learned the importance of validating AI-generated content before including it in business reports.
